

## Homework 7

Follow the instructions of the protein design lecture today, walk through the binder design procedure at least once, then tweak it for your own favorite target / design protocol, obtain the final structure predicted by alphafold2, and get a picture of the structure using PyMol.

As a submission for the homework, show the picture of the binder you designed, and write a paragraph about what you did, and how you'd evaluate the result of your binder design.

This will be due in two weeks, Nov 20th, our last lecture.
